

greenline maxim

- ▶ LEAD-FREE STABILIZERS
- ▶ RECYCLING AND CONSERVATION OF RESOURCES
- ▶ ENERGY EFFICIENCY AND CO₂ REDUCTION

Sustainability, as we understand it, is more than just environmental protection. For us, it means being mindful of the needs of the markets and our customers. That is why, in addition to ecology, economic aspects and issues of social responsibility also play a central role for us.

With our greenline maxim, we think ahead, create brand values and excellent opportunities on the market for our customers: because energy-efficient window systems, lead-free stabilizers in the virgin material and intelligent recycling concepts ensure a plus in sustainability.

Our products meet all requirements for thermal insulation and the associated energy efficiency. They are characterized by a sustainable CO₂ balance and a superior price-performance ratio combined with high durability. As a result, they meet and exceed the functional market requirements of window contractors, architects, property developers and end users.

We deliberately work with proportions of recycled material in our profiles because this, through our specific know-how, leads to even better products and stands for resource efficiency and thus responsible action. Furthermore, as a founding member of a nationwide recycling initiative, we guarantee the recycling of old plastic windows in a closed loop.

With the aim of further optimizing the added value of the window, our engineers are developing the latest product generations with lower material usage and at the same time improved technical product properties. Intelligent chamber systems and static design features ensure the conservation of resources on the one hand and lead to exceptionally competitive products on the other.

Ultimately, our goal is to provide our partner companies and their customers with ecologically and economically well designed system solutions that they can choose with confidence and responsibility.
